

Business Problem Statement

A retail business aims to gain deeper insights into customer purchasing behavior to improve sales performance, customer engagement, and long-term retention. The management team has observed changing buying patterns across different demographics, product categories, and shopping preferences.

The company wants to understand how factors such as discounts, customer reviews, seasonal trends, and payment methods influence purchasing decisions and repeat buying behavior.

The objective of this project is to analyze customer shopping data and answer the following business question:

“How can customer shopping data be used to identify buying trends, strengthen customer loyalty, and support smarter marketing and product decisions?”
